

This listing of claims will replace all prior versions, and listings, of claims in the application.

**Listing of Claims:**

1. (Currently Amended) A business process service debugger for remotely debugging a business process service, comprising:

means for establishing a communications connection with a remote computer, wherein the remote computer is implementing the business process service;

means for reading stored state information regarding events related to at least one business process ~~amongst a plurality of business processes~~ implemented ~~on~~ for the business process service; ~~and~~

means for displaying a symbolic representation of the operation of the business process service based on the stored state information; and

means for remotely debugging the ~~one~~ business process service ~~by way of using the symbolic representation,~~ communications connection and ~~according to the~~ stored state information.

2. (Currently Amended) The business process service debugger of claim 1, ~~further comprising means for displaying the business process service as a graphical image wherein~~ business processes and instances of the business process service other than those being debugged are not disrupted during debugging.

3. (Currently Amended) The business process service debugger of claim ~~2~~ 1, wherein the ~~graphical image~~ symbolic representation comprises a workflow of at least one business process in the business process service.

4. (Currently Amended) The business process service debugger of claim ~~2~~ 1, further comprising means for interacting with the business process service according to a user instruction.

5. (Original) The business process service debugger of claim 1, wherein the stored state information corresponds to a variable assignment within the business process service.

6. (Currently Amended) The business process service debugger of claim 1, wherein the events are historical events that occurred prior to failure of the at least one business process.
7. (Previously Presented) The business process service debugger of claim 1, wherein the stored state information corresponds to message flow data and an order in which run time components performed the one business process as a result of message processing.
8. (Original) The business process service debugger of claim 1, wherein said reading means further comprises means for reading stored business process service configuration information.
9. (Previously Presented) The business process service debugger of claim 1, wherein the events are events that occur prior to an inserted breakpoint in the one business process.
10. (Original) The business process service debugger of claim 1, wherein said debugging means comprises means for detecting a location where the instance is being processed.
11. (Original) The business process service debugger of claim 1, wherein said debugging means comprises means for detecting a location where the instance state is being stored.
12. (Currently Amended) A system for remotely debugging a distributed transactional application, comprising:
  - a server, ~~wherein the server runs a~~ configured to execute an instance of a business process service comprising a plurality of business processes, thereby generating runtime data;
  - a client computer ~~for running~~ configured to execute a debugging user interface (UI) process, ~~wherein the UI process that~~ establishes a communications connection with the server according to a user instruction, and further generates a requests runtime data for at least one of the plurality of business processes ~~request for debugging an orchestration service instance that is implementing at least one of the plurality of business processes, the runtime request being carried out by using a engine debugging interface for depositing a debugging request in~~

~~a message box database, and generates a symbolic representation of the business service process showing any debugging break points specified by a user; and~~  
~~an interceptor for identifying the location within the business process service according to monitoring the runtime data and, when the location a specified break point is identified, causing the server to carry out the runtime request enter or leave a debugging state.~~

13. (Original) The system of claim 12, further comprising a database for receiving the runtime data and for storing business process service state information.

14. (Currently Amended) The system of claim 13, further comprising a display device; ~~wherein the display device presents a shape corresponding to the business process service for displaying the symbolic representation based on the business process service state information, and an a user input device, wherein the input device receives the user instruction is used to specify debugging break points.~~

15. (Currently Amended) The system of claim 14, wherein the ~~display device further presents~~ symbolic representation comprises a workflow representative of the program flow of the business process service.

16. (Currently Amended) The system of claim 14, wherein the display device further ~~presents~~ displays data representative of ~~the a~~ message flow of the business process service.

17. (Currently Amended) The system of claim 14, wherein the ~~shape~~ symbolic representation is presented according to stored state information.

18. (Currently Amended) The system of claim 12, wherein ~~the a~~ message box database is coupled ~~to the engine debugging interface between the server and client computer~~ and is configured for ~~performing specialized tasks relating to at least one of the plurality of business processes~~ communicating debugging requests from the client computer.

19. (Currently Amended) The system of claim 18, wherein the UI process comprises an application program interface for communicating with the ~~first~~ message box database.
20. (Currently Amended) The system of claim 18, further comprising a tracking database to receive business process service tracking information, wherein the UI process comprises a UI component for communicating with the ~~second~~ tracking database.
21. (Canceled)
22. (Canceled)
23. (Original) The system of claim 12, wherein the interceptor is a component of a computer language that provides stored state tracking information.
24. (Original) The system of claim 12, wherein the UI process detects a location where the instance is being processed.
25. (Original) The system of claim 12, wherein the UI process detects a location where the instance state is being stored.
26. (Currently Amended) A method for debugging an instance of a business process service ~~instance~~ running on a remote computer, comprising:  
generating for display, in a graphical user interface (GUI), a symbolic representation of the business process service based on a correlation of information about the design and execution of the business process service;  
receiving a debugging command generated by a user interacting with the GUI;  
~~if the business process service is in a debug mode,~~ establishing a direct client connection channel with the remote computer;  
causing an interceptor to monitor runtime data regarding generated by the instance of the business process service ~~to find a location within the service based on stored state information in accordance with the debugging command;~~

receiving a runtime request, generated by a user interacting with the GUI, for event information ~~pertaining to~~ generated by execution of the instance of the business process service ~~instance in the business process service, the event information comprising historical message flow information, and identification of events that occurred previously in the business process after the process has completed successfully or failed with an error; and~~   
 ~~processing~~ sending the runtime request at to the remote computer for processing by the remote computer with respect to the location within the instance.

27. (Original) The method of claim 26, further comprising:  
querying a database containing a status of the business process service;  
displaying a query result on a display device;  
receiving user input with respect to the query result; and  
establishing the direct client connection channel in response to the user input.
28. (Original) The method of claim 27, wherein the information contained in the database is instance runtime data.
29. (Original) The method of claim 27, wherein the information contained in the database is instance tracking data.
30. (Currently Amended) The method of claim 26, further comprising:  
creating the business process service using a process designer;  
saving a business process service configuration and symbolic data in a database as information about the design of the business process service;  
~~displaying a graphical representation of the business process service~~ the symbolic representation on a display device according to the saved business process service configuration and symbolic data;  
generating a runtime request based on the ~~graphical~~ symbolic representation; and  
displaying a result of the runtime request on the display device.

31. (Currently Amended) The method of claim 30, wherein the ~~graphical~~ symbolic representation comprises a shape corresponding to an operation in the business process service.
32. (Currently Amended) The method of claim 30, wherein the ~~graphical~~ symbolic representation comprises a workflow representation of the business process service.
33. (Original) The method of claim 30, wherein the saving step takes place in connection with compiling and deploying the business process service.
34. (Original) The method of claim 30, wherein the business process service is implemented in a computer language that provides stored state information.
35. (Currently Amended) The method of claim ~~30~~ 26, wherein the ~~interceptor request~~ debugging command is a break point.
36. (Canceled)
37. (Currently Amended) The method of claim 26, wherein the runtime data ~~regarding the instance~~ is state information.
38. (Original) The method of claim 26, further comprising detecting a location where the instance is being processed.
39. (Original) The method of claim 26, further comprising detecting a location where an instance state is being stored.
40. (Currently Amended) A method in a computer system for displaying on a display device a graphical debugging environment for a business process service ~~debugger~~, the method comprising:  
obtaining design information about the business process service;

~~querying a database for obtaining tracking information regarding about execution of~~  
the business process service, ~~wherein the query includes a reference to an identifier that is~~  
~~stored along with a set of tracked events for debugging purposes;~~

~~receiving a query result and generating a shape representative~~ symbolic representation  
of the operation of the business process service according to the identifier design information  
and tracking information; and

~~presenting the shape, the tracking information according to the query result, and a~~  
~~debugging option on the display device.~~

displaying on the display device a graphical debugging environment showing the  
symbolic representation.

41. (Original) The method of claim 40, further comprising receiving runtime data for the business process service and presenting the runtime data on the display device.

42. (Previously Presented) The method of claim 41, wherein the runtime data comprises historical message flow information including identification of run time messages that were constructed as a result of processing received messages, and further comprises order information pertaining to the order in which different run time components were executed as a result of processing received messages.

43. (Currently Amended) The method of claim 40, wherein the ~~debugging option is~~ graphical debugging environment enables a user to place a breakpoint in the symbolic representation of the operation of the business process service.

44. (Currently Amended) The method of claim 40, ~~further comprising presenting the~~ symbolic representation comprising symbols, wherein the graphical debugging environment also displays information about the symbols ~~a content of a message according to the process.~~

45. (Currently Amended) The method of claim 40, further comprising receiving input from an input device to place a break point proximate a ~~shape~~ symbol, and presenting a symbol representing the break point on the ~~display device~~ symbolic representation.

46. (Currently Amended) A computer-readable storage medium having computer-executable instructions for performing a method for debugging an instance of a business process service running on a remote computer, comprising:

generating for display, in a graphical user interface (GUI), a symbolic representation of the business process service based on a correlation of information about the design and execution of the business process service;

receiving a debugging command generated by a user interacting with the GUI;  
~~if the business process service is in a debug mode,~~ establishing a direct client connection channel with the remote computer;

causing an interceptor to monitor runtime data ~~regarding generated by the instance of the business process service to find a location within the service based on stored state configuration, the monitored data being selected for purposes of debugging and including information on when a business process was started, when the business process was ended, and whether the business process succeeded or failed~~ in accordance with the debugging command;

receiving a runtime request; and  
~~processing~~ sending the runtime request ~~at to~~ the remote computer ~~with respect to the instance for processing by the remote computer.~~

47. (Previously Presented) The computer-readable storage medium of claim 46, wherein the method further comprises:

querying a database containing a status of the business process service;  
displaying a query result on a display device;  
receiving user input with respect to the query result; and  
establishing the direct client connection channel in response to the user input.

48. (Previously Presented) The computer-readable storage medium of claim 47, wherein the information contained in the database is instance runtime data.

49. (Previously Presented) The computer-readable storage medium of claim 47, wherein the information contained in the database is instance tracking data.

50. (Currently Amended) The computer-readable storage medium of claim 46, wherein the method further comprises:

creating the business process service using a process designer;

saving business process service configuration data in a database as information about the design of the business process service;

displaying ~~a graphical representation of the business process service~~ the symbolic representation on a display device according to the saved business process service configuration data;

generating a runtime request based on the ~~graphical~~ symbolic representation; and  
displaying a result of the runtime request on the display device.

51. (Currently Amended) The computer-readable storage medium of claim 50, wherein the ~~graphical~~ symbolic representation comprises a shape corresponding to an operation in the business process service.

52. (Currently Amended) The computer-readable storage medium of claim 50, wherein the ~~graphical~~ symbolic comprises a workflow representation of the business process service.

53. (Previously Presented) The computer-readable storage medium of claim 50, wherein the saving step takes place in connection with compiling and deploying the business process service.

54. (Previously Presented) The computer-readable storage medium of claim 50, wherein the business process service is implemented in a computer language that provides stored state information.

55. (Currently Amended) The computer-readable storage medium of claim 50, wherein the ~~runtime request~~ debugging command is a break point.

56. (Currently Amended) The computer-readable storage medium of claim 50, wherein the ~~runtime request~~ debugging command is a request for data regarding an instance of the business process service.

57. (Currently Amended) The computer-readable storage medium of claim 56, wherein the runtime data ~~regarding the instance~~ is state information.

58. (Previously Presented) The computer-readable storage medium of claim 46, wherein the method further comprises detecting a location where the instance is being processed.

59. (Previously Presented) The computer-readable storage medium of claim 46, wherein the method further comprises detecting a location where an instance state is being stored.

60. (Currently Amended) A computer-readable storage medium having computer-executable instructions for performing a method for displaying on a display device a graphical debugging environment for a business process service debugger, the method comprising:

obtaining design information about the business process service;

~~querying a database for~~ obtaining configuration information ~~regarding about~~ the business process service, ~~wherein the query includes a reference to an identifier that is stored along with the configuration information for debugging purposes;~~

~~receiving a query result and generating a shape representative~~ symbolic representation of the operation of the business process service according to the ~~identifier~~ design information and configuration information; and

~~presenting the shape, the configuration information according to the query result, and a debugging option on the display device.~~

displaying on the display device a graphical debugging environment showing the symbolic representation.

61. (Previously Presented) The computer-readable storage medium of claim 60, wherein the method further comprises receiving runtime data for the business process service and presenting the runtime data on the display device.
62. (Previously Presented) The computer-readable storage medium of claim 61, wherein the runtime data comprises message flow information.
63. (Currently Amended) The computer-readable storage medium of claim 60, wherein the ~~debugging option is~~ graphical debugging environment enables a user to place a breakpoint in the symbolic representation of the operation of the business process service.
64. (Currently Amended) The computer-readable storage medium of claim 60, the symbolic representation comprising symbols, wherein the ~~method further comprises presenting a content of a message according to the process~~ graphical debugging environment also displays information about the symbols.
65. (Currently Amended) The computer-readable storage medium of claim 60, wherein the method further comprises receiving input from an input device to place a break point proximate a ~~shape~~ symbol, and presenting a symbol representing the break point on the ~~display device~~ symbolic representation.
